

## HOW IT WORKS

The Report Management System uses Microsoft® Reporting Services and SQL Server 2005. A client component is installed on a local machine for management of the report filters and security. Access to Reporting Services is via the Web. User security for Reporting Services is based on using Microsoft® Windows® Active Directory and that has been fully integrated into the Report Management System.

Data level security is provided to insure that a user like an AE is allowed to only view data associated with their contracts. Enabling Discrete Business Units in conjunction with Report Management System further limits access to data when generating reports.

The Report Management System offers additional inventory options including the ability to check inventory across zone groups. In addition to this users have the flexibility to check inventory for individual clients or contracts on a line by line basis.

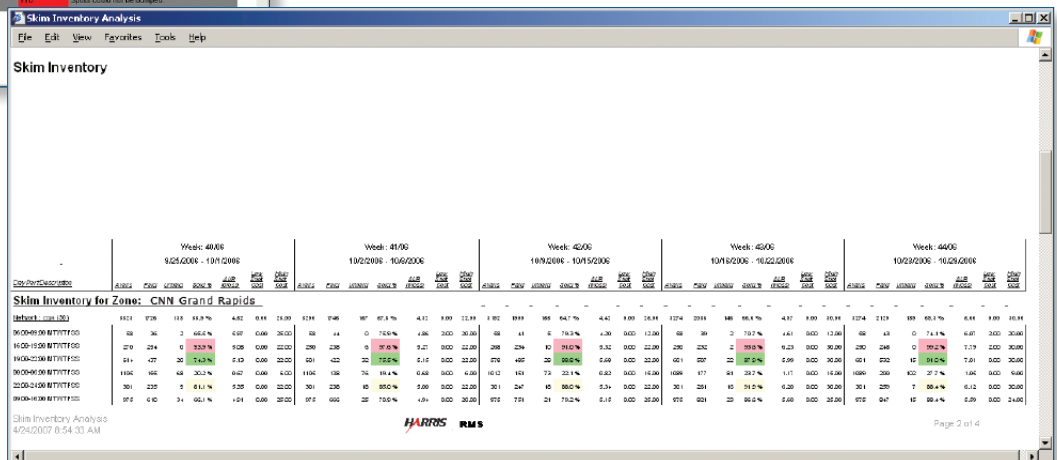

Inventory Check by Contract

## REPORTS INCLUDE:

- Client Spot Listing
- Aged Accounts Receivable
- Yearly Revenue Projection
- Preempt/MakeGood History
- Inventory
- Check Inventory
- Skim Detail
