

Panacea™ Web

Web-Based Ethernet Remote Control of Panacea Routers

Panacea™ Web offers direct-to-the-frame Internet access to Panacea™ routing switchers. Convenient and affordable, Panacea Web is the perfect addition for enhancing remote control of your Panacea router.

True Web Access to Panacea Routers

Panacea Web provides a direct-to-router web access solution, allowing access to router control and status via any Internet-enabled device through any standard web browser (Internet Explorer, Netscape, Mozilla). Panacea Web frees users from being in the office to control and monitor the router, while freeing facilities from the need to add external devices for remote control.

Advanced Features

In addition to the single-bus or multibus GUI-based control panel views, Panacea Web offers panel configuration settings and terminal access to status, configuration and alarm verification; and secures user-access control with defined user and administrator access levels.

Security is Paramount

Panacea Web provides secure levels of access. An administrator access level is provided to establish and control user accounts. The administrator creates user names and passwords, and defines access limits to specific sources and destinations. In addition, time out disconnects can be defined to ensure that inactive sessions are limited. User access is denied to all users without administrative setup.

Logging Functions

Logging functions are provided to further enhance the value provided by Panacea Web. All switch commands are logged with time, date and initiator notes, offering cost-effective system for monitoring and cataloging. Logging can be downloaded as a file or viewed online.
